## Introduction

This website is used to inform people about the NBA Nuggets Basketball team. The website has pictures, highlights, news, and statistics to showcase multiple facets of the Nuggets team. Used as somewhat of a fanpage, people can come here to read about the latest happenings with the Nuggets. It includes a little bit of history with the jerseys through the years on the home page, leads into current stats and roster information, and then leads into current news for projected future stats and standings of the Denver Nuggets.

My audience ranges everywhere from people who have been nuggets fans for years to those who are just starting to get into NBA basketball and following the Nuggets. To target all audiences my website has everything from basic news and player names to last years and previous career stats. My audience is able to include a variety of Nuggets fans because it has some cool information--such as jerseys through the years-- that avid fans may not be familiar with, as well as the roster of the Nuggets, which new fans won't be super familiar with.

### Goals

My website is a fanpage for the Denver Nuggets. The purpose of my website is to inform current and future fans of Nuggets players, stats, history, and news. Fans can access my website and walk away informed about how players stacked up last season and throughout their career, which players are rookies, as well as the basics such as their name, number, age, and height. Users will be able to walk away and know more about the Nuggets history, present, and future. Fans will be able to stay updated with news and learn about player stats from this website.

### Design

I did some research on other websites that had team rosters on them and got inspiration from them. I used prior knowledge about the type of information I would want on a fan page as if I was just getting into the Nuggets team and included a bunch of that information. I couldn't include everything I wanted just because of the volume of information there is to know about the Nuggets, but I feel like I included the basic and most important information. The design didn't turn out exactly like I thought it would, I changed the layout of a couple things. I was hoping to have a scroll image css/bootstrap feature but there were no tutorials of the exact image I had in my brain so I turned the jerseys into a grid layout instead which still worked well. I also realized after creating my site plans that my News page wouldn't work because I needed images and my own text on every page so I changed that one around as well.

### Conclusion

I learned a lot more about web development and all the many aspects that go into it. I learned how to structure a website from the bottom up, from creating a site plan with color combos, fonts, and wireframes to finishing the css and javascript of the page to make it look and

function as I imagined. I learned while creating a website that one has to be aware of what the audience is going to want, rather than purely what they want to design. I think these skills will help me even though I never plan on going into web development, knowing about how websites are created gives me an insight if/when I work with web developers in my company. I will better be able to communicate with them and discuss in technical terms what needs to be accomplished.
